## Abstracts

The global Reactor Active Zone Device market size is predicted to grow from US$ 6016 million in 2025 to US$ 10280 million in 2031; it is expected to grow at a CAGR of 9.3% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

The reactor active region device is the core part of the nuclear reactor, mainly including fuel assemblies, control rods, coolant channels and structural materials, etc. It is the main area where nuclear fission reactions occur and energy is released. Its function is to maintain the controllability and stability of the chain fission reaction, while efficiently transferring the heat generated by fission. Different types of reactors (such as pressurized water reactors, boiling water reactors, fast neutron reactors, etc.) have different requirements for the structural design and material selection of the active region device to ensure reaction efficiency, safety and economy.

With the development of nuclear energy technology, the reactor active region device is evolving towards higher safety, higher fuel utilization and stronger accident resistance. The new generation of reactors (such as the fourth-generation fast reactor, modular small reactor, molten salt reactor, etc.) emphasizes the use of advanced fuels, high-performance cladding materials and passive safety systems in the active region design to meet the needs of higher temperatures and longer operating cycles. At the same time, digital design and intelligent monitoring technology are also widely used in active region optimization and operation status management, promoting the development of nuclear power plants in a safer, more efficient and greener direction.
