Reactor coolant pumps, commonly known as main pumps, are the "heart" of a nuclear power plant's reactor coolant system. Their function is to drive the circulation of radioactive coolant through the reactor's primary loop in extremely high-temperature, high-pressure, and radioactive environments, carrying away the enormous heat generated by the reactor core. They are one of the most critical pieces of equipment ensuring the safe and stable operation of a nuclear power plant. Reactor coolant pump refurbishment is a complex service integrating high-precision technology, nuclear safety culture, and extensive engineering management. The global market is primarily dominated by a few giants, and the competition and cooperation among them are highly complex.
