A reactor internal refers to the structured components installed inside a distillation, absorption, or reaction column to enhance efficiency in mass and heat transfer, phase separation, and chemical reactions. These internals typically include trays (sieve, valve, or bubble-cap), packing materials (structured or random), distributors, support grids, and mist eliminators. Their primary function is to maximize contact between gas (or vapor) and liquid phases, ensuring optimal reaction conditions, improved separation, and reduced energy consumption. Properly designed internals minimize pressure drop, prevent flooding or weeping, and maintain uniform flow distribution. They are critical in industries like petroleum refining, petrochemicals, and chemical processing, where precise control over reaction and separation processes is essential for productivity and product quality.

United States market for Reactor Internals is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
