Reading assistive devices for visually impaired people refer to reading assistive devices designed for visually impaired people. Such devices use high-tech means to help visually impaired people solve reading difficulties and enable them to better obtain information and knowledge.

Visual impairment usually includes low vision and blindness. Low vision refers to vision that is not enough to carry out daily activities, and even after correction, it cannot reach the vision standard of normal people; while blindness refers to the complete lack of perception of light and the inability to perceive any image through the normal visual pathway. In response to these visual impairments, reading assistive devices use a variety of technical means, such as text magnification and speech synthesis, to meet the needs of users with different degrees of visual impairment.

These reading assistive devices not only improve the reading efficiency of visually impaired people, but also greatly enhance their independence and quality of life. By using these devices, they can obtain information more independently, participate in social activities, and enjoy the fun of reading.
