Real Time Digital Simulation System (RTDS) is the product of the development of digital simulation technology, computer technology and parallel processing technology. It not only has the characteristics of digital simulation, but more importantly, through the adoption of parallel processing technology and the design of specialized hardware, it ensures the real-time performance of RTDS operation and the ability to have closed-loop testing. RTDS can complete real-time simulation operations of large-scale power systems in extremely short steps (such as 50 microseconds), providing an effective means for engineers and technicians in the field of power systems to study complex power system phenomena.

The real-time digital simulation system is essentially a parallel computer system specially designed to realize real-time simulation of the transient process of the power system. Its hardware mainly consists of a background workstation and several layers of 6U chassis. The background workstation usually runs the graphical user interface PSCAD and communicates with the RTDS real-time simulation chassis using Ethernet. The simulation software platform (such as RSCAD) and hardware platform (such as NovaCor) of RTDS are specially designed for real-time simulation of power systems. They can run in real time and combine the advantages of digital simulation software and analog simulators.

In short, the real-time digital simulation system is a high-performance power system simulation tool that can provide powerful support for research and testing in the power system field.

The global Real-Time Digital Simulation System?RTDS? market size is projected to grow from US\$ 627 million in 2024 to US\$ 911 million in 2030; it is expected to grow at a CAGR of 6.4% from 2024 to 2030.
