Abstracts

According to this study, the global Recirculating Aquaculture Salmon Network (RAS-N) market size will reach US\$ 1345 million by 2031.

The Recirculating Aquaculture Salmon Network (RAS-N) is a salmon farming model based on the recirculating aquaculture system (RAS). It simulates the natural growth environment of salmon through highly controllable land-based facilities to achieve water resource recycling, aquaculture waste treatment and biosafety. The system integrates engineering, biology, automated control and other technologies, purifies water through physical filtration, biodegradation, gas exchange and other processes, and uses an intelligent monitoring system to dynamically adjust parameters such as water temperature, dissolved oxygen, and light to provide optimal growth conditions for salmon. Its core goal is to achieve high-density, high-quality salmon farming through efficient resource utilization and precise management, while reducing dependence on natural water bodies and environmental pollution.

Analysis of the development trend, driving factors and obstacles of the recirculating aquaculture salmon network (RAS-N) industry

I. Development trend

Technology upgrade and intelligence

RAS-N system will further integrate the Internet of Things, big data and artificial intelligence technologies to realize real-time monitoring and automatic control of parameters such as water quality, dissolved oxygen and temperature, and improve

aquaculture efficiency and stability. For example, the intelligent sensor system can accurately control the aquaculture environment and increase the survival rate by 15%-20%; the penetration rate of automated equipment such as intelligent feeding robots and underwater inspection drones will exceed 60%, reducing labor costs by more than 30%.

II. Driving factors

Market demand growth

With the global population growth and consumption upgrade, the demand for high-protein, low-fat salmon and other aquatic products continues to increase. The RAS-N system can provide stable and high-quality supply to meet market demand.

III. Obstacles

High initial investment and operating costs

RAS-N system requires high equipment procurement and plant construction costs, and professional technicians are required to maintain it during operation, which increases the economic pressure on enterprises. For example, the system includes a variety of equipment such as protein removers, fish counting and grading systems, and the initial investment is huge.
