Abstracts

According to this study, the global Reclaim Silicon Wafer market size will reach US\$ 1096 million by 2031.

The source of the Reclaim Silicon Wafer comes from the monitor wafers and the dummy wafers but not the defect wafers manufactured by the semiconductor fab. Semiconductor manufacturing requires delicate processing. So, equipment environment checks and tests are carried out frequently. Monitor wafers and dummy wafers, which could not qualify as prime wafers, are used for these tasks. Following such use, many of these wafers have their film removed using a chemical solution, and then are re-polished to a mirror finish. After that, these reclaimed wafers can once again be used to check equipment environment, or in equipment operation tests.

Global key players of Reclaim Silicon Wafer include RS Technologies, Kinik, Phoenix Silicon International, Hamada Rectech, Mimasu Semiconductor Industry, etc. The top five players hold a share over 74%. China Taiwan is the largest market, which has a share about 46%, followed by Japan and United States with a market share of 33% and 7%, respectively. In terms of product type, Dummy Wafers is the largest segment, occupied for a share of 78%. And in terms of application, IDM is the largest segment, which has a share about 70%.

The driving force behind wafer reclamation services mainly stems from the semiconductor industry's growing demand for cost control, environmental protection, and sustainable resource utilization. As global consumption of electronic products continues to rise, the scale of the semiconductor industry expands, leading to a significant increase in the demand for raw materials, especially silicon wafers. However, the extraction and processing of high-purity silicon not only consume a large amount of

energy and are costly but also pose environmental pressures. Therefore, recycling and reusing old or defective wafers has become a way to reduce financial burdens on companies while promoting green production. Additionally, many countries and regions have introduced policies and regulations to encourage the development of a circular economy in response to the United Nations' Sustainable Development Goals (SDGs), further promoting the growth of the wafer reclamation market.

In terms of trends, with technological advancements and increased environmental awareness, wafer reclamation services are developing towards more efficient and cleaner directions. On one hand, the industry is actively exploring more advanced processing techniques and methods to improve recovery efficiency and product quality, such as using chemical methods to remove surface contaminants or physical methods to repair minor damages. On the other hand, there is an increasing emphasis on collaboration and information sharing among enterprises to build a closed-loop system covering the entire process from collection to remanufacturing. At the same time, digital transformation is becoming a highlight in this field, where the use of Internet of Things (IoT) and Artificial Intelligence (AI) can achieve precise monitoring and intelligent scheduling of the entire reclamation process, thereby effectively enhancing operational flexibility and response speed. In summary, under the combined influence of multiple factors, wafer reclamation services are poised to become a new business sector that benefits both economic efficiency and social sustainability.
