The recoilless destructor system is a device that can eliminate or significantly reduce the impact of recoil during item destruction operations. Backseat force refers to the backward impact force generated by the reaction force of an object during launch, explosion, and other processes. In traditional destruction equipment, recoil may cause instability, difficulty in operation, and even damage to the device. The recoilless destruction system uses special structures and principles to balance or counteract recoil, such as using recoil gas, hydraulic shock absorbers, and other technical means. This system is commonly used for destroying dangerous goods such as firearms, ammunition, explosives, etc. While ensuring the safety and reliability of the destruction process, it improves the convenience of operation and the stability of equipment, reducing the impact of destruction operations on the surrounding environment and personnel.
