Recombinant human epidermal growth factor topical solution is a highly active biological agent used to promote skin repair and tissue regeneration. It is widely used in wound care, cosmetic dermatology, burn plastic surgery and other fields. Through genetic recombination technology, this product efficiently expresses proteins with the same structure as the human body's natural epidermal growth factor (EGF) in carriers such as Escherichia coli or yeast, and has good biocompatibility and high biological activity. After topical application, EGF can bind to the skin surface receptors, stimulate the proliferation and migration of keratinocytes and fibroblasts, promote collagen production, accelerate wound healing, and improve the quality of tissue repair. The solution is usually a colorless and transparent liquid and can be used for laser surgery, acne scars, chronic ulcers, skin cracks, and injuries caused by radiotherapy and chemotherapy.
