The global Recombinant Human Follicle Stimulating Hormone Injection market size is predicted to grow from US\$ 1350 million in 2025 to US\$ 1950 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

Recombinant follicle stimulating hormone is used in the treatment of female infertility and male hypogonadism. It is used in women who have a problem in ovulation or are undergoing fertility treatment like in-vitro fertilization. In men, it helps in the production of sperm cells.

Infertility affects many people at some point in their lives, according to a new report from the World Health Organization (WHO) released in 2023. About 17.5% of adults (about one in six people worldwide) experience infertility, highlighting the urgent need to expand access to affordable, high-quality reproductive health care for those who need it. Recombinant human follicle stimulating hormone is used in the treatment of female infertility and male hypogonadism. The safety and effectiveness of recombinant human follicle stimulating hormone have been verified in a large number of clinical applications. In the future, as biosimilar technology continues to mature and costs decrease, generic drugs will gradually break the market monopoly of original drugs and improve the accessibility of treatment. Generic drug companies will further enhance their market competitiveness by optimizing production processes, improving product quality and developing long-acting preparations.
