Abstracts

According to this study, the global Recombinant Human Follitropin market size will reach US\$ 2072 million by 2031.

Follitropin is a form of recombinant human follicle stimulating hormone used to stimulate follicle development in women with primary ovarian hypogonadism and in men with hypogonadotropic hypogonadism.

Infertility affects many people at some point in their lives, according to a new report from the World Health Organization (WHO) released in 2023. About 17.5% of adults (about one in six people worldwide) experience infertility, highlighting the urgent need to expand access to affordable, high-quality reproductive health care for those who need it. Recombinant human follitropin is used in the treatment of female infertility and male hypogonadism. The safety and effectiveness of recombinant human follitropin have been verified in a large number of clinical applications. In the future, as biosimilar technology continues to mature and costs decrease, generic drugs will gradually break the market monopoly of original drugs and improve the accessibility of treatment. Generic drug companies will further enhance their market competitiveness by optimizing production processes, improving product quality and developing long-acting preparations.
