The global Recombinant Human Somatropin for Injection market size is predicted to grow from US\$ 2604 million in 2025 to US\$ 3349 million in 2032; it is expected to grow at a CAGR of 3.7% from 2026 to 2032.

Recombinant Human Somatropin, commonly known as somatropin or human growth hormone (hGH), is a synthetic form of the growth hormone produced naturally in the human body. Somatropin is created using recombinant DNA technology, and it is structurally identical to the growth hormone secreted by the pituitary gland. It is used for various medical and non-medical purposes.

Recombinant Human Somatropin for Injection is a widely used biopharmaceutical in the medical field, primarily employed in the treatment of growth hormone deficiency, short stature, muscle wasting, and related conditions. The market size is substantial, driven by ongoing concerns related to endocrine and growth issues in both children and adults. Sales of the product have steadily increased over the years and are expected to continue to show potential in the future, particularly with the introduction of new therapeutic applications and improved delivery methods, such as enhanced injection devices. Furthermore, as medical science and technology continue to advance, recombinant human somatropin may find applications in a broader spectrum of health fields, creating more opportunities for its future development.
