Recombinant Human Thymosin Beta 4 Protein, also known as TB-500, is a synthetic version of a naturally occurring protein called thymosin beta 4. Thymosin beta 4 is found in most tissues of the body and has a variety of biological functions. TB-500 is created

through the process of recombinant DNA technology, where the gene for thymosin beta 4 is inserted into a suitable expression system, such as bacteria or yeast. The expression system then produces large quantities of the protein, which can be purified and used for research, therapeutic, or investigational purposes. TB-500 has been studied for its potential therapeutic benefits in tissue repair and regeneration. It is believed to promote cell migration, angiogenesis (the formation of new blood vessels), and the production of extracellular matrix proteins, all of which are important processes in wound healing and tissue regeneration. TB-500 has shown promise in preclinical and early clinical studies for a range of conditions, including muscle and tendon injuries, corneal wound healing, and cardiac repair. Additional research is ongoing to further understand its potential applications and effectiveness.
