The component of recombinant streptokinase for injection is recombinant streptokinase. Recombinant streptokinase combines with plasminogen at a molar ratio of 1:1 to form a complex, and then activates plasminogen into plasmin, which mainly catalyzes thrombus. Matrix fibrin is hydrolyzed, thereby dissolving thrombi and recanalizing blood vessels; at the same time, the thrombolytic effect of recombinant streptokinase is enhanced by the presence of fibrin, so recombinant streptokinase can effectively and specifically dissolve thrombi or blood clots, and can treat thrombosis as the main cause. Diseases with pathological changes. It is clinically used for thrombotic diseases such as acute myocardial infarction.

United States market for Recombinant Streptokinase for Injection is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
