According to this study, the global Reconfigurable Intelligent Metasurface Technology market size will reach US\$ 1487 million by 2031.

Reconfigurable Intelligent Metasurface (RIS) Technology is a novel wireless communication enhancement technology that integrates artificial electromagnetic metamaterials with modern mobile communication technology.

RIS consists of reconfigurable artificial electromagnetic metamaterials, which contain a large number of independent passive sub-wavelength resonant units. These units can independently control the electromagnetic characteristics such as the phase, amplitude, and polarization of electromagnetic waves. By changing the unit structure and spatial distribution of the array elements, the reflection, scattering, and refraction of radio waves can be controlled to offset the destructive effects of multipath fading. In this way, without complex coding - decoding and radio - frequency processing, RIS can achieve the directional reflection and enhancement of incident electromagnetic waves, thereby improving communication quality and efficiency.

RIS technology is currently a key technology in 5G - A and 6G research. It is expected to break through the uncontrollability of traditional communication, reshape the wireless transmission environment, and solve pain points such as coverage and energy consumption.
