## Abstracts

The global Recycled Chopped Carbon Fiber market size is predicted to grow from US\$ 411 million in 2025 to US\$ 735 million in 2032; it is expected to grow at a CAGR of 8.7% from 2026 to 2032.

The gross profit margin of major companies in the industry is between 25% – 38%.

Recycled Chopped Carbon Fiber refers to short-length carbon fibers recovered from production scrap or end-of-life composite materials through thermal, mechanical, or chemical recycling processes. These fibers retain a significant portion of their original strength and stiffness, making them suitable for reinforcing thermoplastics, thermosets, and molding compounds. Compared with virgin carbon fiber, recycled chopped fibers offer lower cost and reduced environmental impact, supporting sustainable composite manufacturing across automotive, aerospace, consumer goods, and industrial applications.

The industrial chain of Recycled Chopped Carbon Fiber begins with upstream sources such as composite waste, prepreg scrap, aerospace components, and industrial carbon fiber residues. Midstream processes include sorting, shredding, pyrolysis or solvolysis treatment, fiber cleaning, sizing application, and precision chopping. Downstream applications cover injection molding compounds, sheet molding compounds, 3D printing materials, automotive lightweight parts, electrical housings, sporting goods, and construction reinforcement. Supporting services include material testing, formulation optimization, compounding technology, and sustainability certification to ensure consistent mechanical performance and traceable recycled content.
