Battery recycling is a recycling activity that aims to reduce the number of batteries being disposed as municipal solid waste. Batteries contain a number of heavy metals and toxic chemicals and disposing of them by the same process as regular trash has raised concerns over soil contamination and water pollution.

Lithium-ion batteries and lithium iron phosphate (LiFePO4) batteries often contain among other useful metals high-grade copper and aluminium in addition to – depending on the active material – transition metals cobalt and nickel as well as rare earths. To prevent a future shortage of cobalt, nickel, and lithium and to enable a sustainable life

cycle of these technologies, recycling processes for lithium batteries are needed. These processes have to regain not only cobalt, nickel, copper, and aluminium from spent battery cells, but also a significant share of lithium. In order to achieve this goal, several unit operations are combined into complex process chains, especially considering the task to recover high rates of valuable materials with regard to involved safety issues.

Rising demand for electric vehicles: The increasing demand for electric vehicles (EVs) is a key driver for the recycling of automotive lithium-ion batteries. EVs require lithium-ion batteries to power their electric motors. As the sales of EVs grow, the demand for new batteries increases, leading to a parallel demand for recycling and reusing old batteries.

Government regulations and policies: Governments worldwide are promoting the use of EVs and supporting recycling initiatives to reduce environmental pollution and promote sustainable practices. Policies and regulations regarding battery recycling are becoming stricter, which is leading to an increase in recycling activities.

Developing battery swapping technologies: The development of battery swapping technologies is another driver for the recycling of automotive lithium-ion batteries. Battery swapping involves removing the depleted battery from the EV and replacing it with a charged one. This technology allows for the efficient reuse of batteries, reducing the need for new batteries and increasing the demand for recycling.
