## Abstracts

The global Reduced Carbonyl Iron Powder market size is predicted to grow from US\$ 88.08 million in 2025 to US\$ 143 million in 2032; it is expected to grow at a CAGR of 7.3% from 2026 to 2032.

Iron powder is created by combining various iron particles. Iron carbonyl is a volatile compound formed by iron reacting with carbon monoxide, exhibiting distinct coordination chemistry. Its distinctive properties make it a key player in catalytic processes and an intriguing subject of study in organometallic chemistry. The 20 to 200 microns is the size range of iron powder particles. The three types of iron powder that are readily available commercially are reduced iron powder, electrified iron powder, and atomized powder. Due to its advantageous qualities, including good compatibility, high purity, and good sintering, the reduced type is utilised to create automobile components including pulleys, shock absorbers, and sprockets.

Rapid population growth and increased disposable income are the main drivers boosting demand for cars. Powdered iron is used in the automobile industry to manufacture a range of parts and components, including bearings, gears, camshaft pulleys, and crankshaft sprockets. Powdered iron is additionally used for cutting, welding, and other duties during the manufacturing of structural components. Techniques like metal injection moulding and additive manufacturing are also becoming more popular in the automotive industry since they can produce complicated shapes. Automobile manufacturers including Porsche, Mercedes-Benz, and Volkswagen produce parts and components using additive manufacturing technology. These initiatives are predicted to take off during the anticipated time frame and aid in the market growth for iron powder. Thus, driving the Carbonyl Iron Powder market revenue.
