The global Reflectarray Antenna market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Reflectarray antenna is a large antenna system composed of several small antennas, which are arranged into an 'array' according to a specific geometric shape. This antenna works by space feeding. Its core is to shift the phase of the incident wave scattering by adjusting the resonant unit on the dielectric plate, so that the reflected wave can be in phase in the desired direction, forming a highly directional pencil beam. Reflectarray antennas combine the advantages of parabolic antennas and microstrip reflectarray antennas and are widely used in communication systems.

Reflectarray antenna, as a type of antenna that combines the advantages of reflector antenna and phased array antenna, has received extensive attention and application in wireless communication, satellite communication and other fields in recent years. Reflectarray antenna technology is relatively mature and has been verified in many fields. For example, in satellite communication, reflectarray antenna has gradually become an important form of satellite antenna due to its advantages such as low profile, light weight, easy deployment and flexible beam shape. In addition, with the continuous advancement of communication technology and the continuous expansion of application fields, the market demand for reflectarray antenna is also changing. For example, in the field of satellite communication, with the increase in the demand for antenna weight, volume and beam scanning, the advantages of reflectarray antenna are gradually highlighted.
