A reflective fiber collimator is an optical component based on a parabolic reflector design, used to collimate the light beam emitted by an optical fiber into a parallel beam. Its core feature is the use of a 90° off-axis parabolic reflector, which can collimate light of different wavelengths to the same focus without the need for adjustment. Since the focal length of the parabolic reflector remains unchanged over a wide wavelength range, this allows the collimator to work stably over multiple wavelength ranges.
