The reflective film for semiconductor lighting is an important part of high-end LED panel lights. Its main purpose is to reflect the light leaked from the light guide plate back to the light-emitting surface, thereby improving light utilization, energy saving, and brightening. The structure of the reflective film for lighting is similar to that of the reflective film for liquid crystal display, both of which are ABA-type three-layer structures formed by multi-layer co-extrusion technology. Due to the compact structure of LED panel lights, it is easy to cause local overheating, so the reflective film for semiconductor lighting is required to have lower thermal shrinkage and higher stiffness than the reflective film for liquid crystal display.
