The global Reflective Optical Sensor market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

A reflective optical sensor is a device that uses light to detect the presence or absence of an object. It consists of a light emitter, such as an LED, and a light detector, such as a photodiode or phototransistor. The emitter emits light, which is then reflected off the surface of an object and detected by the detector. The sensor can determine the presence or absence of the object based on the amount of reflected light. Reflective optical sensors are commonly used in various applications, such as object detection, position sensing, and proximity sensing.
