The refractory materials used in the converter are roughly the same in each factory: on the layer adjacent to the steel furnace shell, a permanent lining is made by ramming with brine combined with magnesium refractory ramming material, with a thickness of 50-100mm. Then, magnesium bricks or magnesium chromium bricks are laid as working lining, with a thickness of 300-500mm. The lining in the tuyere and slag line areas is easily damaged and is the weak link of the converter. Generally, direct bonding of magnesium chromium bricks or fused casting of magnesium chromium bricks are used.
