The global Refrigerated Centrifuge Rotor market size is predicted to grow from US\$ 178 million in 2025 to US\$ 252 million in 2031; it is expected to grow at a CAGR of 6.0% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

The refrigerated centrifuge rotor is the core component of the refrigerated centrifuge. It is used to hold and rotate samples, and achieve sample separation through the centrifugal force generated by high-speed rotation in a low-temperature environment. It is usually made of metal materials (such as aluminum alloy, stainless steel, etc.), with high strength and corrosion resistance. According to the sample type and separation requirements, it can be divided into different types such as angle rotors and horizontal rotors. The centrifuge tube in the angle rotor is at a fixed angle with the shaft, which is suitable for high-speed centrifugation, can provide high centrifugal force, and can quickly collect sediments; when the horizontal rotor is running, the basket is in a horizontal state, and the sample sediment is concentrated at the bottom of the centrifuge tube, which is more suitable for chromatographic separation of larger volume samples.
