Regenerated cellulose filament is a continuous filament fiber made from natural cellulose (such as wood pulp and cotton linters) through a chemical dissolution-spinning-regeneration process. Essentially, natural cellulose is converted into a spinnable solution, which is then spun in a coagulation bath via wet or dry-wet spinning to produce continuous fibers. Regenerated cellulose filament exhibits a silky luster, soft feel, and excellent moisture absorption and breathability. It is commonly used in textiles, decorative materials, industrial silk, and medical materials, and is a typical regenerated fiber.In 2024, the global production of regenerated cellulose filament will reach 53,590 tons, with an average selling price of US$5,020 per ton.

United States market for Regenerated Cellulose Filament is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Regenerated Cellulose Filament is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
