## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Regenerative drives allow motors to produce positive torque or negative torque. When the motor operates in one of these two modes, a regenerative drive can take the electrical energy generated by the motor and feed it back to the AC power source or to a common bus that supplies two or more drives. A common bus provides additional energy savings in that the power is only converted from AC to DC one time. When it is regenerated to the bus and passed to another inverter, it doesn't have to be converted. In either case—whether it is fed back to the source or to a common bus—the generated energy is used again, rather than being completely lost to heat, as is the case with a traditional dynamic brake.

The global market for Regenerative Drives is estimated to increase from US\$ million in 2021 to reach US\$ million by 2028, exhibiting a CAGR of % during 2022-2028. Keeping in mind the uncertainties of COVID-19 and Russia-Ukraine War, we are continuously tracking and evaluating the direct as well as the indirect influence of the pandemic on different end use sectors. These insights are included in the report as a major market contributor.

The APAC Regenerative Drives market is expected at value of US\$ million in 2022 and grow at approximately % CAGR during 2022 and 2028.

The United States Regenerative Drives market is expected at value of US\$ million in 2022 and grow at approximately % CAGR during 2022 and 2028.

The Europe Regenerative Drives market is expected at value of US\$ million in 2022 and grow at approximately % CAGR during 2022 and 2028.

The China Regenerative Drives market is expected at value of US\$ million in 2022 and grow at approximately % CAGR during 2022 and 2028.
