Regenerative media filter is a type of filtration system that uses a filter media, typically a bed of granular material, to remove impurities from a fluid stream. Unlike disposable filters, regenerative media filters can be cleaned and reused multiple times, which makes them more cost-effective and environmentally friendly. The filter operates through a combination of physical and chemical cleaning mechanisms, such as backwashing, agitation, and chemical regeneration, to remove trapped particles and restore the filter media's filtration efficiency. These filters are commonly used in water treatment applications to remove suspended solids, turbidity, and other contaminants from the water.
