## Abstracts

The global Relay Valve market size is predicted to grow from US\$ 985 million in 2025 to US\$ 1274 million in 2031; it is expected to grow at a CAGR of 4.4% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

A relay valve is an air-operated valve typically used in air brake systems to remotely control the brakes at the rear of a heavy truck or semi-trailer in a tractor-trailer combination. Relay valves are necessary in heavy trucks in order to speed-up rear-brake application and release, since air takes longer to travel to the rear of the vehicle than the front of the vehicle, where the front service brakes, foot-valve, parking-control valve, and trailer-supply valve (if applicable) are located.

The relay valve within a vehicle is an air pressure operated device that collects signals from the driver when they apply the brake. It is commonly found on larger vehicles, such as buses and tractor trailers, because of their size. The velocity that is built up behind these vehicles is substantially higher than an average vehicle would be, so in order to stop properly a special braking system must be in place.
