The global Reluctance Switch market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Reluctance Switch is an electronic switch that works based on the magnetoresistance effect. It consists of a magnetoresistive element and a control circuit. The magneto-resistive element is usually a magneto-resistive or magneto-resistive sensor whose resistance changes in response to changes in the surrounding magnetic field. The control circuit realizes the control of the switch by detecting the resistance change of the magnetoresistive element. When a magnetic field acts on the magnetoresistive element, its resistance value will change. The control circuit can determine whether there is a magnetic field by detecting the change of the resistance value, and convert it into a control signal of the switch state. The magnetoresistive switch has fast response speed, simple structure, high sensitivity, high stability, low power consumption, etc., and can be used in various applications.

United States market for Reluctance Switch is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
