A remote-access VPN allows individual users to establish secure connections with a remote computer network. Those users can access the secure resources on that network as if they were directly plugged in to the network's servers.

In a Remote-access VPNs, individual hosts or clients, such as telecommuters, mobile users, and extranet consumers, are able to access a company network securely over the Internet. Each host typically has VPN client software loaded or uses a web-based client.

A remote-access VPN host or client typically has VPN client software. Whenever the host tries to send any information, the VPN client software encapsulates and encrypts the information before sending it over the Internet to the VPN gateway at the edge of the target network. On receipt, the VPN gateway handles the data in the same way as it would handle data from a site-to-site VPN.
