Abstracts

The global Remote-Controlled Fluoroscopy System market size is predicted to grow from US$ 1498 million in 2025 to US$ 2435 million in 2032; it is expected to grow at a CAGR of 7.3% from 2026 to 2032.

Remote-Controlled Fluoroscopy System is a medical imaging device that uses continuous X-rays to produce real-time moving images of internal body structures, allowing physicians to observe dynamic processes such as organ movement or the passage of contrast agents. It typically integrates a patient examination table, an X-ray generator, an image intensifier or flat-panel detector, and digital image processing technology to provide high-quality diagnostic visualization for procedures in radiology, gastroenterology, and interventional medicine. The unit price of Remote-Controlled Fluoroscopy System is approximately between US$100k and US$500k. In 2024, the sales volume of Remote-Controlled Fluoroscopy System has reached 4k units, with a gross profit margin of approximately 30%-50%.

The upstream supply chain of remote-controlled fluoroscopy systems mainly involves the production and supply of critical components such as X-ray tubes, flat-panel detectors, image intensifiers, digital imaging sensors, high-voltage generators, control electronics, and mechanical table systems. It also depends on specialized raw materials and parts suppliers providing precision metals, optical glass, radiation shielding materials, and embedded software for imaging control. System manufacturers such as Siemens Healthineers, Philips Healthcare, Shimadzu, and Canon Medical integrate these components into complete fluoroscopy systems, conduct quality testing, and ensure compliance with medical imaging regulations. The downstream supply chain primarily consists of distributors, hospital procurement departments, diagnostic imaging centers, and specialized clinics that use these systems for dynamic imaging and
