Remote pressure difference transmitter is an instrument used to measure the pressure difference between two points during the process. It consists of a pressure sensor and a transmitter that sends signals to the control system or monitoring equipment. Differential

pressure measurement can be used to infer flow rate, liquid level changes, or other process variables. The 'remote' aspect of a transmitter refers to the fact that the sensor and transmitter can be physically separated from each other, providing greater flexibility in installation and monitoring. For example, sensors can be installed in pipelines or tanks, while transmitters are located in control rooms or other safe locations.
