The methane detector fires a laser beam at the target, and then detects the deflected light reflected from the target, and then measures the methane concentration (ppm concentration - distance) between the detector and the target. For high concentration infrared absorption measurement, the meter uses the detection wavelength modulation spectroscopy second harmonic method. A near-infrared tuned diode (InGaAsP DFB laser) with a methane wavelength of 2.3- μ m R(3) was used.

The global Remote Methane Gas Detection market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
