Remote Plasma Source (RPS) is a device used to generate plasma. It is usually used for surface treatment, material modification, film deposition and other processes in a vacuum environment. RPS works by delivering gas into the device, using an electric or magnetic field to generate a plasma, and then delivering the plasma to the surface area that needs to be treated. Unlike traditional plasma sources, RPS usually does not directly contact the surface to be treated, but generates plasma at a certain distance and delivers the plasma to the target surface, so it is called a 'remote plasma source'.

The main advantage of RPS is that it can achieve uniform treatment of the surface, and for some sensitive surfaces or materials, it is far away from the plasma, thus reducing thermal and chemical damage to the surface. In addition, RPS can be integrated into vacuum processing systems, making surface treatment and material modification processes more flexible and efficient.

The global Remote Plasma Sources market size is projected to grow from US\$ 441 million in 2024 to US\$ 1695 million in 2030; it is expected to grow at a CAGR of 25.1% from 2024 to 2030.
