Remote wireless fetal heart rate monitor is a medical device designed to monitor the heart rate of a fetus during pregnancy. It allows healthcare professionals to remotely track the fetal heart rate and monitor the well-being of the unborn baby.

This type of monitor typically consists of a wireless sensor or transducer that is placed on the mother's abdomen to detect and measure the fetal heart rate. The sensor uses ultrasound technology or Doppler technique to capture the heartbeats of the fetus. The data is then wirelessly transmitted to a receiver or monitoring device, which displays the

fetal heart rate in real-time.

Remote wireless fetal heart rate monitors are often used in hospitals and healthcare facilities during antenatal check-ups, labor, or high-risk pregnancies. They provide non-invasive and continuous monitoring of the unborn baby's heart rate, enabling healthcare professionals to detect any abnormalities or signs of distress. This information helps guide medical decisions and interventions to ensure the safety and well-being of both the mother and the baby during pregnancy and childbirth.
