A Renal Sympathetic Denervation (RDN) Ablation System is a catheter-based medical device designed to treat resistant hypertension by ablating the sympathetic nerves surrounding the renal arteries. The system delivers energy—typically radiofrequency, ultrasound, or chemical agents—via a dedicated ablation catheter to disrupt renal sympathetic nerve activity, resulting in long-term blood pressure reduction. It typically comprises an ablation catheter, energy generator, control console, and optional temperature or positioning modules. RDN systems are minimally invasive, reproducible, and are being used in both clinical practice and investigational studies globally.
