Repulpable water-based coatings are environmentally friendly coatings formulated with water as the primary solvent and renewable materials. These coatings are designed to provide barrier properties, moisture resistance, and printability to paper and paperboard products while being fully recyclable and repulpable in the paper recycling process. Unlike conventional coatings that use petroleum-based solvents and synthetic resins, repulpable water-based coatings contain bio-based or biodegradable polymers and additives that do not interfere with the recycling process. After use, paper products coated with repulpable water-based coatings can be easily and efficiently repulped along with other paper fibers during recycling, without the need for costly separation or additional processing steps. Repulpable water-based coatings are widely used in packaging applications, such as food and beverage packaging, where both performance and environmental considerations are important. These coatings offer manufacturers a sustainable alternative to conventional coatings, reducing their environmental footprint and contributing to the circular economy by enabling the reuse of paper fibers in new paper products.

The global Repulpable Water-based Coating market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
