An antibody (also known as an immunoglobulin) is a protective protein produced by the immune system in response to the presence of an antigen. It is a Y-shaped molecule composed of two heavy chains and two light chains, which are held together by disulfide bonds. Each tip of its Y-shaped structure contains a paratope that can specifically bind with an epitope on a corresponding antigen. The antibodies can be then used in a multitude of applications, including but not limited to: western blot (WB), immunoprecipitation (IP), immunofluorescence (IF), immunohistochemistry (IHC), chromatin immunoprecipitation (ChIP), and flow cytometry (FC). As a cornerstone of the body's immune response, antibodies can provide significant data to support scientists' research.
