The global Reservoir Simulation Software market size is predicted to grow from US\$ 763 million in 2025 to US\$ 1303 million in 2032; it is expected to grow at a CAGR of 8.1% from 2026 to 2032.

Reservoir simulation software is a professional tool based on computer technology and geological and fluid mechanics principles. It aims to quantitatively simulate the flow and physicochemical processes of underground oil, gas, and water in complex porous media through mathematical models. It is primarily used to describe the distribution of remaining oil in reservoirs, historical data fitting, predict reservoir development dynamics, and optimize production strategies. It is one of the core technologies for modern oil and gas reservoir development and management.

The primary driving force in the global energy market is the relentless pursuit of efficiency in unconventional resource development. Profitability in shale oil and gas volumetric fracturing and complex well network layouts relies heavily on accurate simulations. The global market is dominated by internationally renowned companies such as Schlumberger, CMG, and Halliburton (Landmark), which hold leading positions thanks to their integrated software suites and extensive industry experience. Meanwhile, domestic companies, represented by China National Petroleum Corporation (CNPC), are emerging in markets like China, seeking breakthroughs through independent research and development.

The focus of competition in the industry has expanded from single simulation algorithms to cloud-native architectures, open data ecosystems, and modular service capabilities that lower the professional barrier. However, the industry's development also faces significant obstacles: high software implementation and maintenance costs, as well as

reliance on highly specialized talent, pose barriers to small and medium-sized companies.
