This report mainly studies Residential Solar Shading Systems. Solar Shading Systems is Shading against solar heat gain is the most readily applicable and flexible method of cooling and can be applied in all climate types in which the sun's influence is significant, and to almost all modern buildings irrespective of latitude. The key to good daylighting and thermal performance lies in the design of the building envelope. Shading devices can be an integral part of the envelope, and thus influence thermal and daylighting performance. They may be located at the external or internal face of the facade, or within double- and triple- glazed window or curtain wall systems. In each case solar radiation is prevented, wholly or partly, from entering the building. By intercepting solar radiation before it reaches the building, external devices are the most.

They include motors to control the shades.

The North America region dominates the shading systems market due to leading technical standards and high levels of trade and consumption. The Asia Pacific region is expected to experience significant changes over the forecast period owing to the rise in construction and restoration of new building shading systems and equipment, and house repairs in the region.
