A resin bearing is a bearing fabricated from a plastic material. Resin bearings are also called plastic bearings. A bearing is a component that receives the rotating shaft of a rotating device and facilitates its rotation. Since resin bearings are made of resin, they are lightweight and can be molded freely. They have high resistance to heat and chemicals, as well as high insulation properties, and can be used in special environments where metals are unsuitable.

Another advantage is that they do not require oil grease or other lubricants, so they require less frequent maintenance. The materials used for resin bearings are mainly synthetic resins, and since there are a wide variety of materials, the optimum material can be selected according to the application.

The global Resin Bearing market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
