The report requires updating with new data and is sent in 48 hours after order is placed.

The resin dryer dries raw resin chips by exchanging heat with dry heated air. Its main working principle is that resin chips are fed into the top hopper and slowly move to the bottom of the hopper, while dry heated air flows from the bottom to the top. The moisture diffused from the inside of the chip due to the heat evaporates and is carried away by the air flow, drying the resin chip. The resin can be thermally processed to achieve the most suitable dryness without degradation.
