Resins for heavy metal water treatment refer to functional ion-exchange resins or chelating resins utilized for the purification of heavy metal-laden water bodies, deep impurity removal, or metal recovery. Their primary function is to remove or concentrate heavy metal ions?such as copper, lead, nickel, zinc, cadmium, cobalt, mercury, and chromium?from the liquid phase through mechanisms involving ion exchange, chelation coordination, or selective adsorption.

The upstream sector primarily comprises functional raw materials, including styrene, divinylbenzene, acrylic monomers, cross-linking agents, and porogens. The midstream sector consists of enterprises engaged in the R&D and manufacturing of these resins; the technological barriers in this segment center primarily on the precise control of the resin's skeletal structure and the modification of its functional groups. The downstream sector finds extensive application in industrial fields with stringent environmental protection requirements, encompassing scenarios such as electroplating, metal surface treatment, mining and metallurgy, and electronic chemicals.

In 2025, global sales volume for resins used in heavy metal water treatment is projected to reach approximately 13,000 tons, with an average global market price of around \$8,000?\$9,000 per ton. The gross profit margins for major industry manufacturers are estimated to range between 25% and 35%.
