A paint or coating is the combination of a pigment, a binder, a solvent, and additives. The binder, or resin, is usually what gives the coating its name, such as polyurethane or acrylic. While the pigment provides a paint with colour, the additives give it extra desirable characteristics, and the solvent gives it the necessary consistency for application, it is the binder that, as the name suggests, binds it all together. The binder is the film-forming component of paint, the vehicle that carries the pigment and then dries or cures, holding it in place. The binder is also responsible for adhesion, durability, flexibility, gloss, and other physical properties. Binders and resins for paint are one of the most important elements of a coating.
