Hot tobacco is also known as heated tobacco or heat-not-burn tobacco or hybrid tobacco. Heated Tobacco Products (HTPs) produce aerosols containing nicotine and other chemicals, which are inhaled by users through the mouth. These use specific tobacco products to be heated at temperatures below combustion levels. Hot tobacco

products release flavors with nicotine and allow the user to enjoy tobacco without combustion. Resistive heating is where an electric current passes through a conductive material and releases heat to its surroundings. The more resistive the material is, the more heat is created. This process is why incandescent light bulbs get hot, for example – the electric current running through the filament heats the filament, making it release heat and light.
