The 'Resistive Level Sensor' is a sensor used to measure the horizontal height of a liquid or the distance from the liquid surface to the bottom of a container. It is based on the principle of resistance change, and the level height is usually determined by measuring the effect of the level in the liquid on the resistance of the sensor. This type of sensor usually consists of two electrodes, one located near the surface of the liquid and the other at the bottom of the container, and the resistance value between the two electrodes changes as the liquid level changes.

The global Resistive Level Sensor market size is projected to grow from US$ million in 2023 to US$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
