The global Resistive Vacuum Transducer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Resistance vacuum transducer is a kind of sensor equipment used to measure vacuum degree, which can convert the pressure change of vacuum system into electrical signal output. The core component of this transmitter is one or more resistive elements. When the vacuum degree changes, the resistance of these resistive elements will also change, which will lead to changes in the output electrical signal, thus realizing the monitoring of the vacuum degree.
