Resonant pressure sensor, also known as frequency sensor, refers to a device that uses a resonant element to convert the measured pressure into a frequency signal. It is mainly composed of a resonator, a mass block, a support seat, a piezoelectric ceramic, etc., and is a type of pressure sensor. One of the subcategories. The working principle of the resonant pressure sensor is that under the action of pressure, the position of the mass block, the support seat and the strength of the piezoelectric ceramic sheet change, thereby causing the natural frequency of the resonator to change, and then the process of determining the size of the pressure is calculated by calculating the change in the resonant frequency.
