The global Resorbable Bone Substitute market size is predicted to grow from US\$ 1091 million in 2025 to US\$ 1708 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

A resorbable bone substitute is a bioceramic material designed to act as a bone void filler in bony voids or gaps in the skeletal system (i.e. extremities, posterolateral spine, and pelvis). It can also be used for common dental procedures such as sinus lifts, periodontal bone filling, and filling of cystic or peri-implant defects. This product provides a bone void filler that is resorbed and replaced by bone during the healing process.

Bone graft substitutes are biological products that can replace autologous bone grafts. The substitutes consist of allograft bone, demineralized bone matrix, polymers, hydroxyapatite, and other materials. These substitutes are used in the treatment of bone defects, in union or non-union surgery, and in orthopedic spinal fusion. Moreover, various advantages of these substitutes, such as safety, biocompatibility, and osteoconductivity to fractures, have increased the applications of these products over the past decade.

The growth of the global bone grafts and substitutes market is attributed to the increasing incidence of bone diseases such as bone infections and bone tumors and increasing number of orthopedic procedures globally. Furthermore, rising demand for synthetic alternatives and surging number of products approved by various agencies are expected to drive market growth over the forecast period.
