The global Resorbable Embolization Microspheres market size is predicted to grow from US$ 524 million in 2025 to US$ 997 million in 2031; it is expected to grow at a CAGR of 11.3% from 2025 to 2031.

Resorbable embolization microspheres are biodegradable medical devices used in minimally invasive procedures to block blood flow to targeted tissues, such as tumors or arteriovenous malformations. These microspheres are typically made from biocompatible materials like polylactic acid (PLA) or gelatin, designed to degrade safely within the body over time. Delivered via a catheter into the blood vessels, they provide temporary occlusion, allowing for localized treatment while minimizing damage to surrounding tissues. Resorbable embolization microspheres are widely used in interventional radiology for conditions like uterine fibroids, liver tumors, and post-traumatic bleeding, offering effective, targeted therapy with reduced long-term complications.

United States market for Resorbable Embolization Microspheres is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Resorbable Embolization Microspheres is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
